NON-COMPETITIVE DIVISION

Texas Disaster Information System

TDIS is an interactive, web-based spatial data system designed to support disaster preparedness, response, recovery, and mitigation in the State of Texas. Once complete, the system will employ statewide data and mapping technologies to create a secured, public network of disaster data information. It will serve as a database to preserve data products generated during disaster response, recovery, and planning missions. This will provide users with accurate information to assess disaster risks, impacts, and mitigation strategies.

Presentation Theme: Texas Disaster Information System

Collaborators, Advisor(s) and Department(s) that assisted with this research: Texas General Land Office, Texas A&M University, University of Texas, Texas Water Development Board, FEMA, USACE, USGS, and NWS.

Funding: Community Development Block Grants- Disaster Recovery (CDBG-DR)
